```

Offline transformation

- > Predefined datasets
- > New file = new metadata
- > Needs XML skills

Online transformation

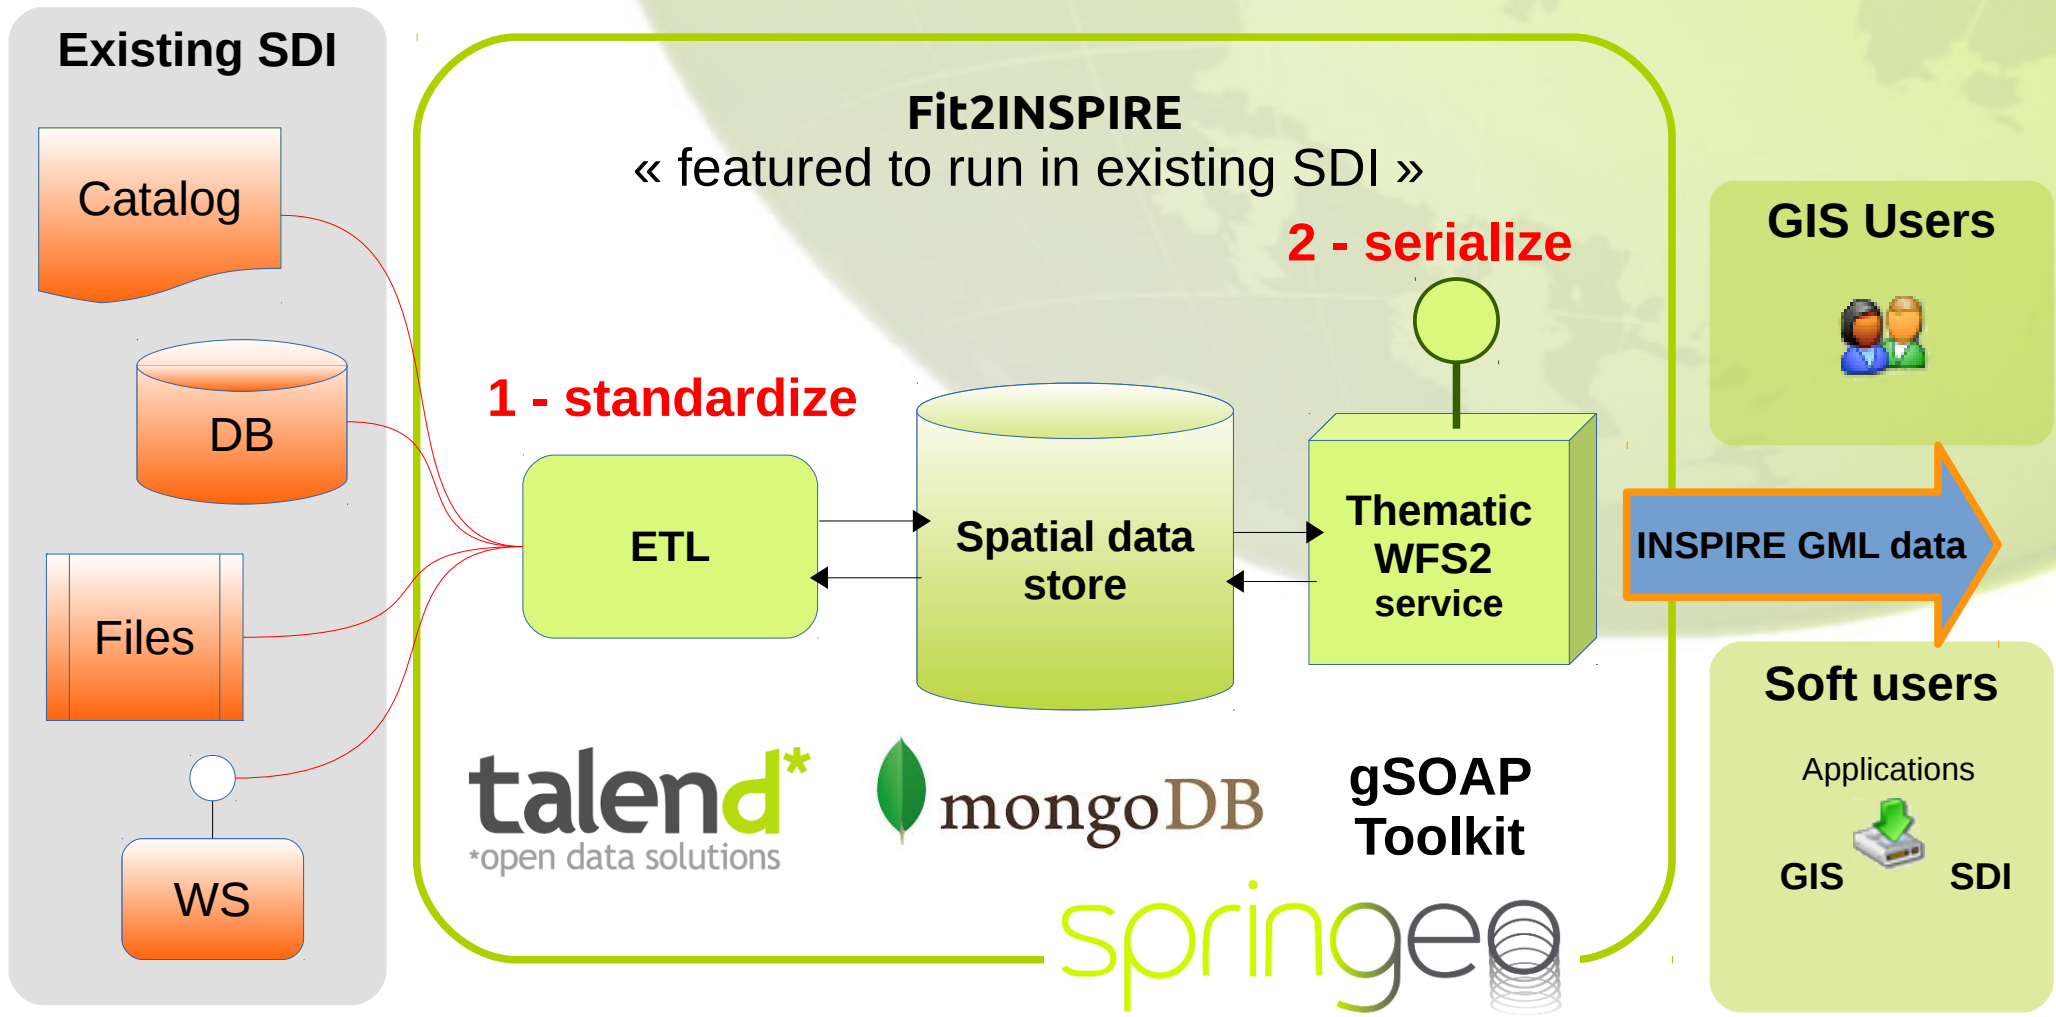

- > Direct and custom access to data
- > "XML-free"
- > Hard to setup

Main drivers

Transformation recipe

Why are we different ?

- ① **Domain specific** : 1 theme, 1 webservice
- ① **Schema driven for a strict interoperability**
- ① **Customization**
 - > Rich GML output according to user needs
- ① **New cocktail of technologies**
 - > Stand-alone server rather than existing servers
 - > NoSQL rather than RDBMS
 - > Open software

Test our online demo
<http://www.springeo.fr/demo>

- **Planned Land Use demo**
 - > 300h of development
 - > 1 server running for 6 months

- **The interoperability challenge is complex**
 - > Work together : bet on your favorite SDI !
 - > Aggregate data before its delivery : one endpoint is better for users

- **SDI are still far from the beginning**

Advantages

- > Less data and metadata to manage
- > XML-free backoffice
- > Complex schema support
- > Lightweight server
- > Fast coding

Drawbacks

- > Suitable only for a significant amount of data
- > Manual standardization step
- > Not scalable in case of many heterogeneous data

- We are working on a UI to facilitate data harmonization on step 1
- We are open to partnerships to share our know-how

Thanks !

Jean-Loup Delaveau

CEO and Geodata manager
