Generation of a 3D road infrastructure database

Road infrastructures

Visual landmarks (semantic features):

- road signs, road surface markings, traffic lights
- Curbs, building facades, etc.

Context

State of the art

Proposed method

► Mapping

Localization

Experiments and evaluations

Conclusions and perspectives

Figure: Semantic landmarks

Advantages

- Stable to time and viewpoint changes
- Precision and robustness of landmarks (with estimated uncertainty)
- Less volume for data storage and matching

Generation of road infrastructure database

Map of 3D road markings (Soheilian et al. 2010)

- Input: a pair of images
- Output: 3D model of markings in sub-decimeter accuracy: parallelogram

Context

State of the art

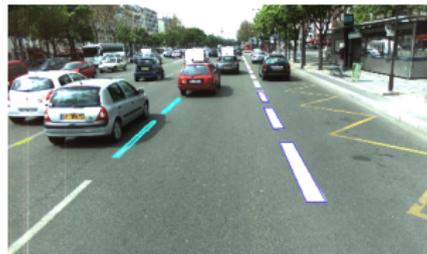

Proposed method

► Mapping

Localization

Experiments and evaluations

Conclusions and perspectives

Generation of infrastructure database

Map of road signs (Soheilian et al. 2013)

- Input: a set of geo-referenced color images
- Output: 3D model of road signs in sub-decimeter accuracy: 3D rectangle, triangle, or circle

Context

State of the art

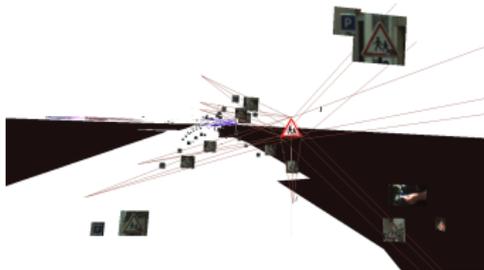

Proposed method

Proposed
method

Mapping

Localization

► Experiments
and
evaluations

Conclusions
and per-
spectives

- True positive (TP): landmarks were detected in images and associated with the corresponding database landmarks;
- False positive (FP): landmarks were detected in images, but associated with wrong database landmarks;
- True negative (TN): there was no corresponding landmark of a detection due to false detection or the incompleteness of the database;
- False negative (FN): landmarks were detected in images but not associated with the corresponding landmarks in database.

Conclusions and perspectives

Conclusions

Conclusion:

- 😊 Alignment method of images by using a database of geo-referenced visual landmarks
- 😊 Reducing the error accumulation of INS by periodic pose correction with visual landmarks
- 😊 Localization INS : $E_p = 185m$ and $E_{alti} = 280m$
- 😊 Localization INS + landmarks : $E_p = 4.5$ and $E_{alti} = 6.7m$
- 😊 Taken into account uncertainty of all the observations (the acceleration measures from INS and the 3D visual landmarks)

Context

State of the art

Proposed method
